

Abstract

During this assignment, we vlogged our process of finding a wildflower and identifying it. During our assignment, we used Analyzing Data and Computational Thinking when we took videos and used them to show the data that we had collected. Another domain that was used was Communicating within a scientific framework, this occurred when we had to use scientific terms to correctly identify our flower parts, then show them clearly in our video production.

Reflection

I learned about wildflowers in my area and I was able to gain knowledge about identifying them in nature. A learning strategy that I used was concrete examples. We had to take our previous knowledge of flowers and examples to then complete it ourselves. We also used elaboration when we had to use the same skills over and over again but with different flowers. If I could do this assignment again I would record more video footage or create different angles and shots.

I did make edits to these videos by correcting flowers that I had gotten wrong and perfecting these videos.
